제주대학교 해양학과

The authors present systematic list of the copepods of Cheju Island that have been the literature reports and those collected from the 13 localities in Cheju Island. In the present list, the total number of species of copepods are 111 species in 28 families. Among them *Paracalanus crassirostris*, *Ctenocalanus longicornis*, *Calocalanus styliremis*, *Aetideus armatus*, *Euchaeta attenuata*, *Paraeuchaeta russelli*, *Metridia pacifica*, *Centropages longicornis*, *Candacia discodata*, *Sapphirina opalina*, *S. darwini* and *S. stella* have not been reported upto now around Cheju Island waters. One hundred and eleven species occupy 61.3% of 181 species that were recorded from Korea. Twenty one species of 111 species(18.9%) were recorded only around Cheju Island, and 97 species of 111 species(87.4%) were found frequently in Kuroshio currents.

Key words : Copepods, Crustacea, Systematic list, Cheju Island

INTRODUCTION

Copepods are the most important metazoan zooplankton in coastal waters because of their numerical dominance and trophic importance. They play an important role in the marine food web, serving as a primary food source for many small carnivores and as grazers on phytoplankton(Kim *et al.*, 1993)

On the systematic study of Korean copepods, previous researcher reported on the Calanoida (Kim, 1985; Kang, 1992), Cyclopoida(Lim, 1989; Kang, 1988) and Harpacticoida(Lee, 1993).

As the result of the previous researches, 181 species of copepods were known around Korean waters, of which 111 species in 28 families were reported from Cheju Island waters. The synthetic and systematic researches of copepods

of Cheju Island were not accomplished. Thus, in the present report the authors intended to grasp overall fauna of copepods of Cheju Island based upon the present materials and the literature published for better understanding of the fauna of copepods and their geographical distribution around Cheju Island.

MATERIALS AND METHODS

The materials consist of the specimens obtained during the period of survey from March 1993 to October 1994 from the 13 localities around and the Cheju Island (Fig. 1). Moreover, the authors included literature published before the present report.

The collections were carried out by

hand net (mesh: 100 μ) on the coast. The materials were preserved in 5% formalin-seawater solution. All specimens were examined with dissecting microscope high power microscope. The authors followed Brodsky(1950)'s for the classification method on taxa above the family level.

All specimens reported are deposited in the Department of Oceanography and Marine Research Institute, Cheju National University, Korea.

SYSTEMATIC LIST

The following systematic list of the fauna includes all the species of copepods which appeared in literature and those newly examined in the present report. In this systematic list,

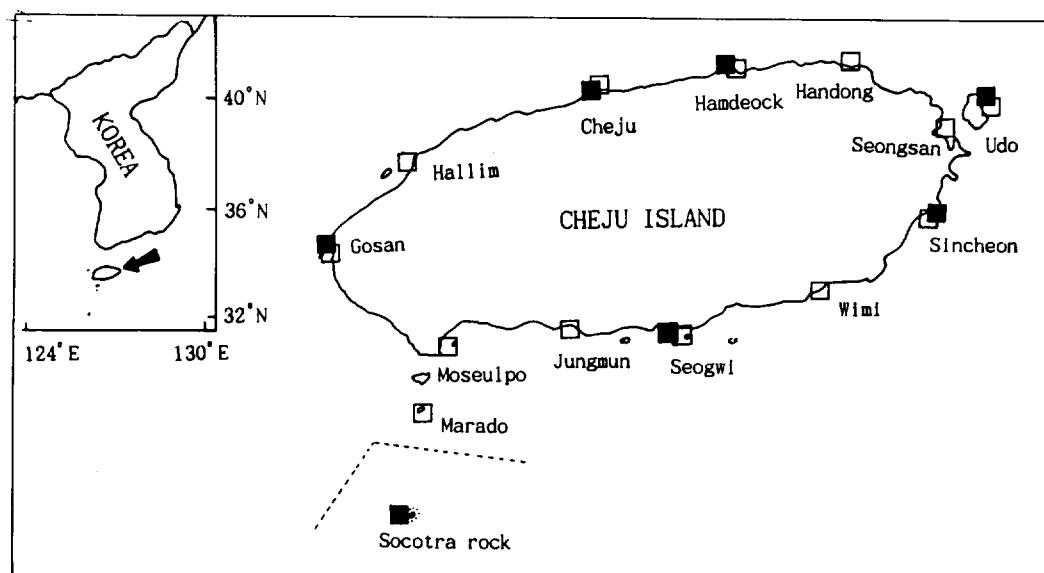

Fig. 1. Map showing localities in Cheju Island where previous and present materials were collected (□: present report; ■: literature record).

the species marked as an asterisk(*) are found only around the Cheju Island up to now. The localities under each species' name are cited from the literature records and then also is given the data of the material examined.

Phylum Arthropoda

Superclass Crustacea pennant, 1777

Class Maxillopoda Dahl, 1856

Subclass Copepoda Milne-Edwards, 1840

Order Calanoida Sars, 1903

Family Calanidae Dana, 1849

Genus Calanus Leach, 1816

1. *Calanus sinicus* Brodsky, 1962

near Socotra(Oh, 1983), Sincheon(Go, 1987, Oh, 1987:), Cheju(Go et al., 1994), Gosan(Ko, 1993: Go et al., 1994), Seogwi(Go et al., 1994)

Material examined:Socotra, 10♂♂, 7♀♀, Apr. 23, 1994:Marado, 10♂♂, 10♀♀, June 15, 1993

2. *Calanus minor* Claus, 1863

DISCUSSION

One hundred and eleven species of copepods in 28 families were identified from the 13 localities around Cheju Island. *Paracalanus crassirostris*, *Ctenocalanus longicornis*, *Calocalanus styliremis*, *Aetideus armatus*, *Euchaeta attenu*, *Paraeuchaeta russelli*, *Metridia pacifica*, *Centropages longicornis*, *Candacia discodata*, *Sapphirina opalina*, *S. darwini* and *S. stella* are unrecorded species up to now around Cheju Island.

The total number of species of copepods in this systematic list are 111 species in 28 families. One hundred and eleven species occupy 61.3% of 181 species from Korean waters up to now. Twenty one species of 109 species(18.9%) are only reported from Cheju Island. Waters around Cheju Island contributes the largest number of southern form of copepods species in the four regions (Donghae Sea(Japan sea), Korea Strait, Yellow Sea and Cheju Island waters) of Korean waters. This fact indicates that

Cheju Island waters are strongly influenced by Tsushima Warm Current with high water temperature and the high salinity of the Korean waters.
